

Software guide

This is a software guide for windows 10 – 64 bit.

- Install the Eclipse Java IDE using the installer
<https://eclipse.org/downloads/eclipse-packages/>.
- On windows, you can run it directly through the deliverable executable package application.
- In the list install the eclipse IDE for enterprise Java developers.
- Before installing accept some license agreement.
- So when the installation is done the IDE can be started directly.
- launch the IDE.
- To start using the Eclipse IDE, double click on the eclipse.exe file.
- Now the workspace app is to be allocated for eclipse ide to store its configuration and click the OK button.
- Java editor is used to modifying the Java source code which is typed by the developer each Java source file is opened in a separate editor.
- To create the Java project select file > new > Java project from the menu.
- enter the project name and press the finish button to create the project.
- To create a Java class select new > class to create a Java class and assign the name for the class employees finish button. This creates a new file with the class.
- to run the application code from the IDE, right-click on the Java class and select run as > Java application.
- The Java project is saved in the eclipse.

So these are the basic configuration of the software in which the end product is executed.
